Master en Técnicas de conservación de la biodiversidad y ecología

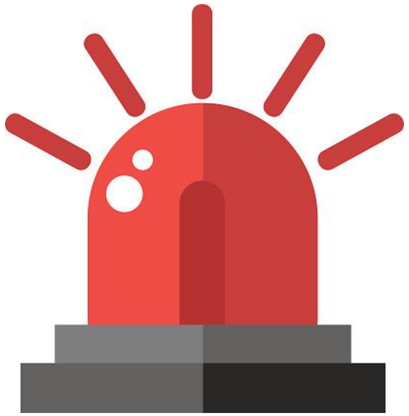
Modelización:

Modelos biofísicos en ecología

Juanvi G. Rubalcaba

Marie-Curie Fellow McGill & URJC

jg.rubalcaba@gmail.com



Material - Máster Técnicas de conservación y Ecología (URJC)

Práctica - Modelo ectotermo

1. Instala R y R-Studio - guía y links -
2. Descarga el código de R de la práctica.
3. Decarga los datos de temperatura para la práctica.
4. Trabajo de prácticas

Presentaciones clase

Presentación teoría

Presentación práctica

Material (presentación práctica y trabajo) : https://jrubalcaba.github.io/posts/material_master/

Datos para la práctica https://we.tl/t-aXhIsO9n87

¿Si aumenta **1ºC la temperatura ambiente**, cuánto cambia la **temperatura del cuerpo**?

Modelos microclimáticos

Modelo biofísico

Modelo comportamental

Aumento esperado (nivel macroclimático)		**Aumento real (microclima)**		**Aumento de temperatura corporal**		**Respuesta comportamental**
+1ºC	➡	+1.2 ºC (sol) +0.8 ºC (sombra)	➡		➡	e.g., pasa más tiempo a la sombra

Modelo ectotermo

Modelo biofísico

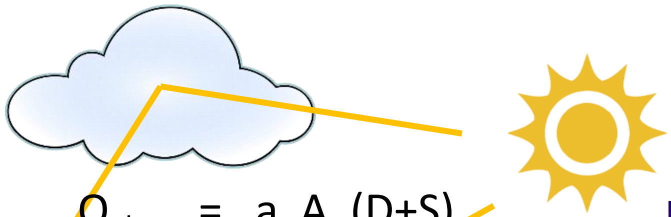
$$C \frac{d\,Tb}{dt} = \text{Entrada de calor} - \text{Salida de calor}$$

Modelo biofísico

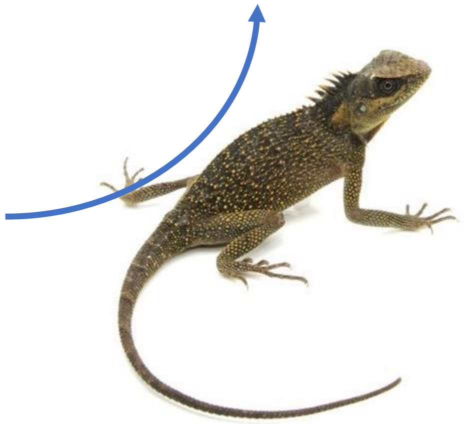
$$Q_{abs} = a \; A \; (D+S)$$

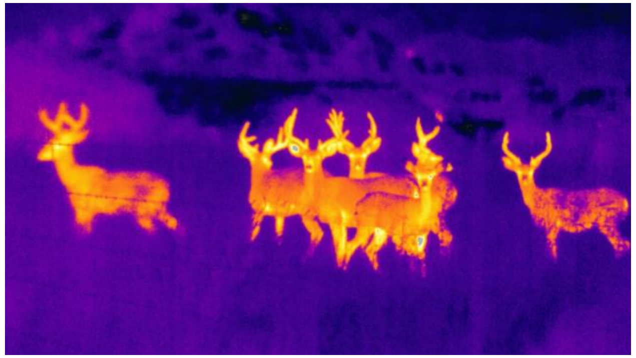
$$[W] \qquad [m^2\,][W\,m^{-2}]$$

Modelo biofísico



$$Q_{abs} = a \; A \; (D+S)$$





Radiación térmica

$$Q_{IR} = - A \, \varepsilon \, \sigma \, [(T_b + 273)^4 - (T_a + 273)^4]$$

Ley de Stefan-Boltzmann

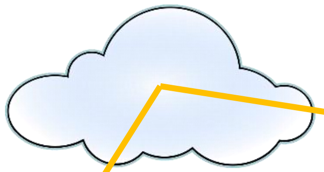
Modelo biofísico

$$Q_{conv} = -\,A h_c (T_b - T_a)$$

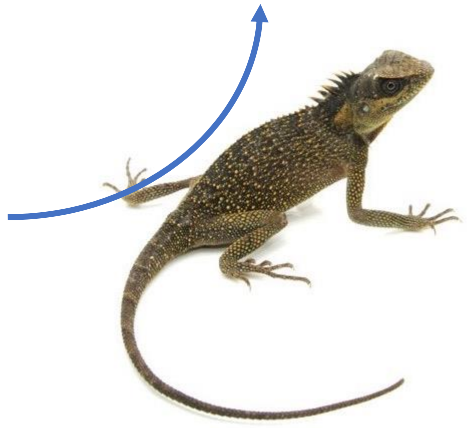
[W] [m²] [Wm⁻² ºC⁻¹] [ºC]

h_c: coeficiente de convección

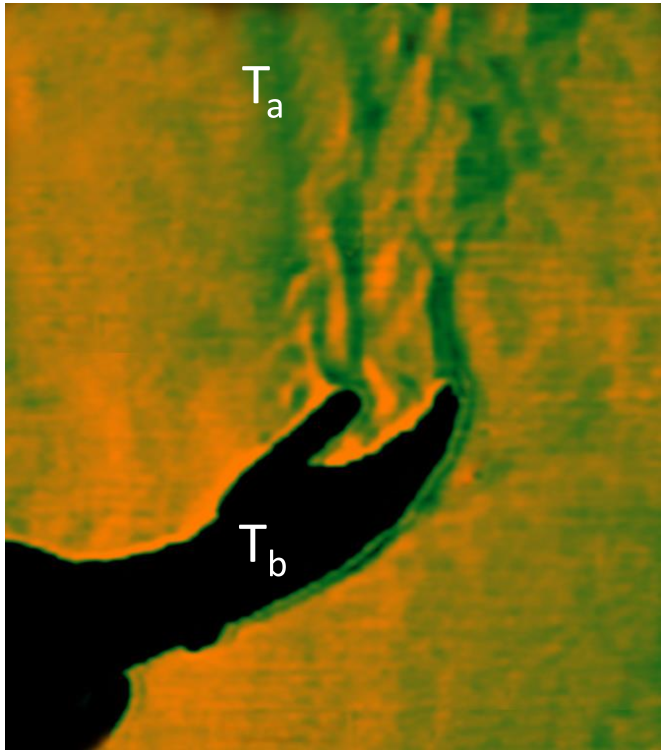
$$\mathbf{h_c = a} \times \text{velocidad viento}^{\mathbf{b}} \times \text{longitud cuerpo}^{\mathbf{-c}}$$



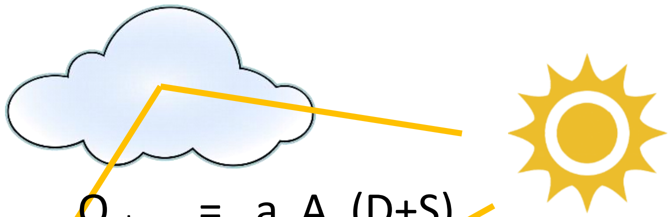
$$Q_{abs} = a\ A\ (D+S)$$



$$Q_{IR} = -\,A\,\varepsilon\,\sigma\,[(T_b + 273)^4 - (T_a + 273)^4]$$

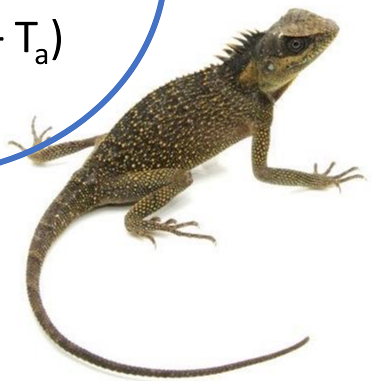


Modelo biofísico



$$Q_{abs} = a\ A\ (D+S)$$

$$Q_{conv} = -\ A\ h_c\ (T_b - T_a)$$



$$Q_{IR} = -\ A\ \varepsilon\ \sigma\ [(T_b + 273)^4 - (T_a + 273)^4]$$

$$Q_{net} = Q_{abs} + Q_{IR} + Q_{conv}$$

Modelo biofísico

Transferencia de calor

$$Q_{net} = Q_{abs} + Q_{IR} + Q_{conv} \qquad [W] = [J\ s^{-1}]$$

Tasa de transferencia de calor

Temperatura corporal, T_b

$$\frac{dT_b}{dt} = \frac{1}{MC} Q_{net} \qquad \frac{[ºC]}{[s]} = \frac{1}{[g][J\ g^{-1}\ ºC^{-1}]} [J\ s^{-1}]$$

Tasa de cambio de temperatura

M = masa (g)

C = capacidad calorífica ($J\ g^{-1}\ ºC^{-1}$)

Temperatura corporal, T_b

$$Q_{net} = Q_{abs} + Q_{IR} + Q_{conv}$$

$$Q_{abs} = A\, a\, (D + S)$$

$$Q_{IR} = -A\, \varepsilon\, \sigma\, (T_b^4 - T_a^4)$$

$$Q_{conv} = -A\, h_c\, (T_b - T_a)$$

Parámetros del lagarto (tamaño, forma y color)

M = 5g

A = 0.0029 m^2

C = 3.7 J g^{-1} ºC^{-1}

a = 0.9

Parámetros ambientales

D = 400 Wm^{-2}

S = 20% de D

Ta = 20 ºC

v = 0.8 m s^{-1}

$$\Delta T_b = \frac{1}{MC} Q_{net}$$

Tiempo	Tb	Q_{abs}	Q_{IR}	Q_{conv}
1	20.000	1.263	0.000	0.000
2	20.792	1.263	-0.012	-0.044
3	21.620	1.263	-0.024	-0.089
4	22.490	1.263	-0.038	-0.137
5	23.408	1.263	-0.052	-0.188
6	24.385	1.263	-0.067	-0.242
7	25.433	1.263	-0.083	-0.300
8	26.569	1.263	-0.101	-0.362
9	27.820	1.263	-0.121	-0.431
10	29.227	1.263	-0.144	-0.509

Temperatura corporal, T_b

$$Q_{net} = Q_{abs} + Q_{IR} + Q_{conv}$$

$$Q_{abs} = A\ a\ (D + S)$$

$$Q_{IR} = -A\ \varepsilon\ \sigma\ (T_b^4 - T_a^4)$$

$$Q_{conv} = -A\ h_c\ (T_b - T_a)$$

Parámetros del lagarto (tamaño, forma y color)

M = 5g

A = 0.0029 m^2

C = 3.7 J g^{-1} ºC^{-1}

a = 0.9

Parámetros ambientales

D = 400 Wm^{-2}

S = 20% de D

Ta = 20 ºC

v = 0.8 m s^{-1}

$$\Delta T_b = \frac{1}{MC} Q_{net}$$

MARIE CURIE ACTIONS

Solución analítica:

modelo transitorio de transferencia de calor

$$\frac{dT_b}{dt} = \frac{1}{cM}(Q_{abs} + Q_{IR} + Q_{conv})$$

$$T_b(t) = T_b(t-1) + \Delta t \frac{1}{cM}(Q_{abs} + Q_{IR} + Q_{conv})$$

Solución numérica por iteración (método de Euler)

Solución analítica:

modelo transitorio de transferencia de calor

$$\frac{dT_b}{dt} = \frac{1}{cM}(Q_{abs} + Q_{IR} + Q_{conv})$$

$$\frac{dT_b}{Q_{abs} + Q_{IR} + Q_{conv}} = \frac{1}{cM}dt$$

$$\int \frac{dT_b}{Q_{abs} + Q_{IR} + Q_{conv}} = \int \frac{1}{cM}dt$$

…

$$\boxed{T_b(t) = \cdots \exp(\ldots tiempo)}$$

Solución analítica:
modelo transitorio de transferencia de calor

$$cM\frac{dT_b}{dt} = Q_{abs} + Q_{IR} + Q_{conv}$$

$$cM\frac{dT_b}{dt} = Aa(D+S) - A\varepsilon\sigma\left(T_b^4 - T_a^4\right) - Ah_c(T_b - T_a)$$

Solución analítica:
modelo transitorio de transferencia de calor

$$cM\frac{dT_b}{dt} = Q_{abs} + Q_{IR} + Q_{conv}$$

$$cM\frac{dT_b}{dt} = Aa(D+S) - A\varepsilon\sigma\left(T_b^4 - T_a^4\right) - Ah_c(T_b - T_a)$$

$$A4\varepsilon\sigma T_a^3(T_b - T_a)$$
